

Simply clean hands!

pr88 protects the skin against contact with oily and greasy dirt as well as paint, lacquer, graphite, soot, tar and bitumen products, dust, (PU-) adhesives artificial resins, polyester, silicone masses, mineral fibres etc. Thanks to an elastic protective film pr88 helps wash off dirt.

Rub in

Before working, rub a hazelnut sized amount of pr88 onto your hands - especially to the finger nails and cuticles.

Work

Only use as much pr88 as it takes for the protective film to dry after approx. 1 minute. The skin is now protected against contact with work materials.

Wash off

After you have finished working, wash your hands with a little water and the dirt will be removed together with pr88.

After you have applied pr88, and have ensured that you have carefully creamed between your fingers, the finger tips and cuticles, rub the rest into the skin with hand washing movements until it is completely dry.

Your skin will still function and your sense of touch will not be affected, meaning you will still be able to hold onto your tools tightly.

If there is any residual dirt left on the skin, please use a skin cleanser from our prClean series. To regenerate the skin during your break or after work, we recommend one of our pr skin care products.
